ABSTRACT

Cytochrome oxidase subunit I (COI) gene sequences of mitochondrial DNA of different species of the genus *Parnassius* downloaded from NCBI (www.ncbi.nlm.nih.gov) were aligned and analyzed to determine the diversity in respect to the percentage of Adenine, Thymine, Guanine and Cytosine, AT content, G + C content, basic melting temperature, relative melting temperature. Mean values of AT content, GC content and Relative melting temperature were 71.7713, 28.2564 and 0.363666 respectively showing a linear regression between GC content and the mean value of Relative melting temperature.

INTRODUCTION

The species under the genus *Parnassius* are basically white swallowtail butterflies (Lepidoptera, Papilionidae, Parnassiinae) having transparent wings, lightly scaled with black, red and blue spots, varying in colour and form depending on the altitude. They have been adapted to high altitudes showing darkened colouration at the wing base (altitudinal melanism). Influence of landscape on the population genetic structure of the alpine butterfly *Parnassius smintheus* (Papilionidae) has been studied (Keyghobadi et al., 1999). Although they are within swallowtail group of butterflies, they do not possess any tail like projections at their hind wings. Defensive organ, osmeterium is present in all larval forms as found in other papilionids (Katoh et al., 2005). Preferred larval food plants belong to the families of stonecrop (Crassulaceae), Poppy (Papaveraceae), Saxifrage (Saxifragaceae) and Caltrop (Zygophyllaceae) (Kehimkar, 2008). The exact number of species within the genus is disputed and numbers range from 38 to 47 (Nazari, 2006). It has been reported that the genus may consist of about fifty species and upto ten species groups or subgenera have been proposed on the basis of morphological and behavioral studies (Weiss, 1992). The *Parnassius* species of butterflies are often hard to identify and the literature regarding phylogeny is scanty. Present work is an attempt to study the nucleotide diversity and molecular characters of *Parnassius* species of butterflies on the basis of cytochrome oxidase subunit I (COI) gene sequences of mitochondrial DNA of different species of *Parnassius* downloaded from NCBI (www.ncbi.nlm.nih.gov).

MATERIALS AND METHODS

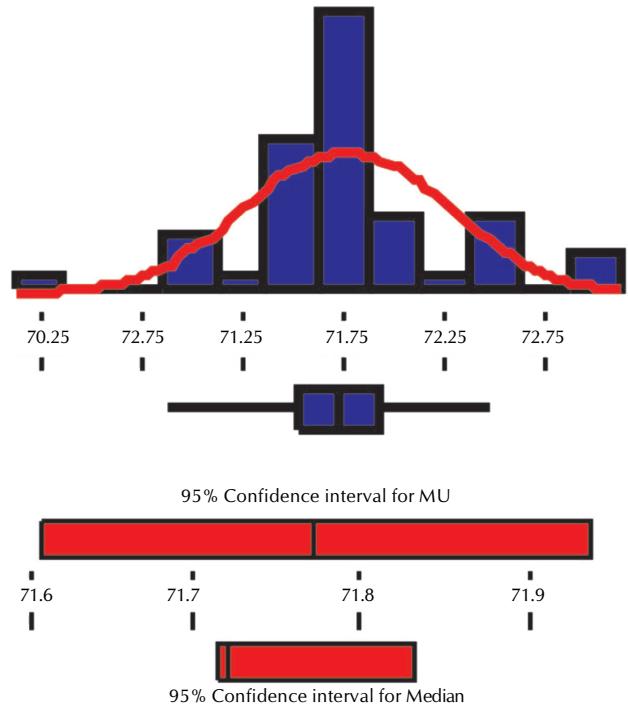

Cytochrome oxidase subunit I (COI) gene sequences of mitochondrial DNA of different species of *Parnassius* were downloaded from NCBI (www.ncbi.nlm.nih.gov). The sequence data were aligned using the 'ClustalW Submission Form' (<http://www.ebi.ac.uk/clustalw/>) and analyzed by ClustalW (Thompson et al., 1994). Sequences were analyzed to determine the diversity in respect to the percentage of Adenine, Thymine, Guanine and Cytosine, AT content, G+C content, basic melting temperature, relative melting temperature of Cytochrome oxidase subunit I (COI) gene sequences of mitochondrial DNA of different species of *Parnassius*. Evolutionary distances were calculated using the method of Jukes and Cantor (Jukes and Cantor, 1969) and a Phylogenetic tree was prepared by 'neighbor-joining' method (Saitou and Nei, 1987; Tamura et al., 2007). Relative melting temperature based on nearest-neighbour thermodynamics (Santalucia, 1998) by $T_m = \text{SumDeltaH}/\text{SumDeltaS}$, where SumDeltaH and SumDeltaS are the summation of the dinucleotide enthalpy and entropy, respectively. T_m is relative because we do not have information on the concentration of the hybridizing strand.

RESULTS AND DISCUSSION

Different species of genus *Parnassius* and their GenBank Entry numbers of the Cytochrome oxidase subunit I (COI) gene sequences of mtDNA have been shown in Table 1. Nucleotide base composition (Mole %) of the sequences of different

species has been depicted in Table 2. Lengths of DNA, Molecular weight, AT and GC content have been shown in Table 3. Mean values of AT and GC content were 71.7713 and 28.2564 respectively. Histogram of AT and GC content are shown in Figs. 1 and 2 respectively. The variance values for AT and GC were 0.259411 and 0.4828 respectively having 95% confidence interval for mean and sigma. The mean value of Relative melting temperature was 0.363666 with the variance 0.000209. A linear regression has been established between GC content and Relative melting temperature (Fig. 3).

Phylogenetic tree (Fig. 4) was done on the basis of cytochrome oxidase subunit I (COI) gene sequences of mt DNA of different species of the genus *Parnassius*. Phylogenetic relationships were derived from a neighbor-joining analysis. The cluster containing the isolates of *Parnassius smintheus* and *Parnassius behrii* branched with isolates of *Parnassius phoebus*. Maximum identity (100%) was observed among the three isolates of *Parnassius stibbendorfi* (FJ663914.1, FJ663913.1 and FJ663912.1). The branch closest to this cluster contains the isolates of *Parnassius staudingeri* (FJ663911.1,

Statistical analysis

Coefficients:

Estimate	Std. Error	t value	Pr(> t)
(Intercept)	3.448e-01	8.642e-03	39.897 < 2e-16 ***
AT content	6.826e-05	8.539e-05	0.799 0.429
GC content	4.951e-04	9.008e-05	5.497 3.27e-06 ***

Relative Melting Temperature is highly co-related with GC content (%) and Corr. (GC content, Relative Tm.) = 0.9721334 The regression equation is Relative Tm. = 0.352 + 0.0004242 GC content. The study on butterflies is of great interest in the field of biodiversity (Dennis et al., 2000; Grill and Cleary, 2003; Schmitt et al., 2005). So the present study bears relevant information in respect to the molecular diversity of different species of *Parnassius*.
