## ABSTRACT

One hundred cowpea genotypes screened under field condition during *kharif*, 2013 and 2014 and further evaluated at greenhouse condition by artificial sap inoculation. The disease incidence varied from 0 to 60 % and 0 to 63.33 % in field and artificial condition respectively. The most of the genotypes studied were categorized as moderately resistant to moderately susceptible. Three out of hundred genotypes appeared to be immune (IC-8966, V-5 and IC-202782) under both in field and artificial condition. The genotypes showed immune and resistant reaction would be utilized as donors to develop BCMV resistant varieties.

## INTRODUCTION

Cowpea (*Vigna unguiculata* L. Walp.) is one of the most important pulse crops native to Central Africa, belongs to family Fabaceae. Among the pulses, cowpea holds an important position in the country (Bashir et al., 2002; Reena Nair and Mehta, 2014). Cowpea is mainly grown mainly as a vegetable and seed purpose and to lesser extent as a fodder crop. Cowpea seed is valued as a nutritional supplement to cereals because of its high protein (25%) content (Basavaraj et al., 2013; Hasan Khan et al., 2015). In India cowpea occupies an area of around a one million hectare with an annual production of 2.24 million tonnes with an average productivity of 570 kg per hectare (Anono, 2013). The main production constraints of pulses in general and cowpea in particular are biotic and abiotic stresses. Diseases are prominent among biotic stresses known to affect the productivity. Cowpea is susceptible to a variety of diseases caused by fungi, bacteria, viruses and nematodes. Of these, viruses constitute the major group of pathogens infecting cowpea (Mali and Thottappilly, 1986).

Cowpea is infected by about 140 viruses worldwide (Hughes and Shoyinka, 2003). Among these viruses infecting cowpea bean common mosaic virus (BCMV) is serious problem belongs to potyvirus group and transmitted by vector aphids and through seeds (Bock and Conti, 1994; Taiwo, 2003). The

occurrence of BCMV on common bean from India was first reported by Muniyappa (1976). Now it is distributed worldwide (Brunt et al., 1996; Taiwo, 2003) and causes a big economic damage by reducing yield as much as 80% and quality of harvested product (Drijfhout, 1991).

Plants which are infected in early stages remain dwarf with small leaves, and less number of branches and fruits. In the present days after realization of severity of disease, farmers have become reluctant in cultivation of cowpea in India. Controlling BCMV incidence is only possible by the way of reducing the vector viz., aphid population using insecticides and use of virus free seeds but, which are ineffective under severe infestations. The application of certain pesticides, which is mostly inefficient, uneconomical, causes environmental hazard and pose a health risk to human beings and cattle.

So, use of virus resistant variety is the best alternative to alleviate occurrence of BCMV disease. Hence, present investigation was mainly focused to screen cowpea genotypes and identify resistant genotypes against BCMV disease through both field and artificial condition.

## MATERIALS AND METHODS

The experimental material in the present study consisted of 100 cowpea genotypes collected from AICRP on Arid legumes, Zonal Agricultural Research Station (ZARS), GVK, Bengaluru.

Initially, cowpea genotypes were screened for their reaction to BCMV disease under field condition during *kharif* season of 2013 and 2014. Under field condition each entry sown in single row of three meter length with the spacing of 45 × 10 cm in two replications. One row infector line C-152 was raised after every ten test entries. All the recommended agronomic practices were followed. No insecticidal spray was given in order to allow the aphid population to spread the disease. Disease incidence was recorded periodically and Percentage Disease Incidence (PDI) was worked out using the formula.

$$\text{Percent disease incidence (PDI)} = \frac{\text{No. of plants infected}}{\text{Total no of plants}} \times 100$$

Then same genotypes of cowpea were evaluated for their resistance to BCMV disease in under artificial condition. The

seeds of each genotype were sown in polythene bags. Eight to ten days old seedlings were mechanically inoculated with virus sap and kept them in insect proof cages for symptoms development. Number of plants infected in each genotype was recorded. The experiment was repeated thrice for accurate results and disease incidence was recorded.

The genotypes were later grouped into different categories based on 0-5 scale from immune to highly susceptible described by Diwakar and Mali (1976) (Table 1).

## RESULTS AND DISCUSSION

In present investigation, 100 genotypes were tested for their reaction to BCMV under field and artificial condition. The disease incidence varied from 0 to 60 and 0 to 63.33 % in field and artificial condition respectively (Table 2 & Table 3). In

**Table 1: Disease scoring Scale (0-5) for BCMV based on disease incidence (%)**

Scale	Description	Category
0	No visible symptoms	Immune
1	1-5 per cent of plants showing symptoms	Resistant
2	5-15 per cent of plants showing symptoms	Moderately resistant
3	15-25 per cent of plants showing symptoms	Moderately susceptible
4	25-50 per cent of plants showing symptoms	Susceptible
5	>50 per cent of plants showing symptoms	Highly susceptible

\*Reaction types: I: Immune; R: Resistant; MR: Moderately resistant; MS: Moderately susceptible; S: Susceptible; HS: Highly susceptible

field condition, among the 100 genotypes screened, 16 genotypes showed immune reaction, 17 genotypes showed resistant reaction, 34 genotypes showed moderately resistant reaction, 21 genotypes moderately susceptible reaction, 10 genotypes showed susceptible reaction and 2 genotypes were showed highly susceptible reaction. In these studies the highest per cent of disease incidence (60%) was observed in IC-243501. Results are presented in the Table 4.

However, the results of 100 genotypes screened under artificial condition against BCMV (Table 5). Among the 100 genotypes screened, 3 genotypes showed immune reaction, 17 genotypes showed resistant reaction, 30 genotypes showed moderately resistant reaction, 21 genotypes moderately susceptible reaction, 19 genotypes susceptible reaction and 10 genotypes were showed highly susceptible reaction. In these studies the highest per cent of disease incidence (63.33%) was observed in IC-204103 and IC-243501. Among all genotypes IC-8966, V-5 and IC-202782 showed immune reaction both in field and artificial condition.

These results presented were in accordance with several workers Bhati et al. (1987), Gumedzoe et al.(1990), Sahoo

and Hota (1991), Gubba (1994). Bashir et al. (2000) and Bashir and Ahmed (2002) identified the resistance in cowpea against black eye cowpea mosaic virus. Two hundred cowpea germplasm accessions were evaluated against black eye cowpea mosaic virus (BICMV), under greenhouse conditions by sap inoculation method.

Suly and Providentii (1995) noted five multiple virus resistant common bean breeding lines. The *phaseolus vulgaris* breeding lines sp6c, sp17b, sp61, sp180d, sp377d were derived from a cross between Great northern 1140; B21 carries resistance to BCMV, BYMV and black eye cowpea mosaic potyvirus (BICMV).

Sharma et al. (2008) evaluated 397 common bean accessions of diverse origin through artificial screening revealed the presence of effective sources of resistance against bean common mosaic virus strains present in Himachal Pradesh of India. 21 accessions were found resistance to NL1n and NL7n strains of BCMV.

Genotypes grouped as immune and resistant category under both in field and artificial condition would be utilized as donors

**Table 4: Grouping of cowpea genotypes based on their reaction against BCMV under field condition.**

Reaction type	Number of genotypes	Genotypes
Immune	16	NBC-1, IC 2196, IC 2918, IC 2815, IC 10810, IC 20645, IC 39916, IC 39947, IC 52110, IC 201079, IC 201095, IC 8966, V-5, 202782, 202891, IC 219872
Resistant	17	IC 5969, IC 7832, IC 19778, IC 20456, IC 20514, IC 20720, IC 26048, IC 39922, IC 39945, IC 52107-I, IC 199702, IC 202720, IC 202779, IC 202791, IC 214833, IC 253270, IC 254430
Moderately resistant	34	KBC-2, IC 9833, IC 20477, IC 20504, IC 20523, IC 22637, IC 26029, IC 39896, IC 52118, IC 52128, IC 202705, IC 202707, IC 202718, IC 202762, IC 202775, IC 202827, IC 202829, IC 202926, IC 206240, IC 214751, IC 214753, IC 214757, IC 219550, IC 219594, IC 249133, IC 249588, IC 249591, IC 253275, IC 253288, IC 259024
Moderately susceptible	21	FTC-27, GC-3, IC 19786-I, IC 19797, IC 20575, IC 20659, IC 39870, IC 52092, IC 52094, IC 202709, IC 202717, IC 202806, IC 202848, IC 214834, IC 2194489, IC 249132, IC 259043, IC 259061, IC 249140, IC 249141, IC 249584, IC 249586
Susceptible	10	IC 19775, IC 20451, IC 39921, IC 102826, IC 202711, IC 202730, IC 204103, IC 219592, IC 219872, IC 259078
Highly susceptible	02	C-152, IC 243501

**Table 5: Grouping of cowpea genotypes based on their reaction against BCMV under artificial condition**

Reaction	Number of genotypes	Genotypes
Immune	03	IC 8966, V-5, 202782
Resistant	17	NBC-1, IC 2196, IC 2918, IC 2815, IC 10810, IC 20523, IC 20645, IC 20659, IC 39916, IC 39947, IC 201079, IC 201095, IC 202720, IC 202791, IC 214833, IC 253270, IC 254430
Moderately resistant	30	IC 5969, IC 7832, IC 9833, IC 20456, IC 20477, IC 20504, IC 20514, IC 20526, IC 20575, IC 26048, IC 39870, IC 39896, IC 39921, IC 39922, IC 39945, IC 52105, IC 52107-A, IC 52110, IC 52118, IC 52128, IC 202891, IC 214751, IC 214753, IC 214757, IC 219871, IC 249588, IC 253275, IC 253288, IC 259024, IC 259061
Moderately susceptible	21	FTC-27, GC-3, IC 19786-I, IC 26029, IC 52092, IC 52094, IC 202705, IC 202707, IC 202709, IC 202718, IC 202762, IC 202779, IC 202827, IC 202829, IC 202926, IC 2194489, IC 219550, IC 249132, IC 249133, IC 249594, IC 259043
Susceptible	19	KBC-2, IC 19775, IC 19778, IC 20720, IC 22637, IC 102826, IC 199702, IC 202711, IC 202775, IC 202848, IC 206240, IC 214834, IC 219594, IC 219872, IC 249140, IC 249141, IC 249584, IC 249586, IC 259078
Highly susceptible	10	C-152, IC 19797, IC 20451, IC 39911, IC 202717, IC 202730, 202806, IC 204103, IC 219592, IC 243501

to develop BCMV resistant lines. In addition, these genotypes will be screened through SSR linked markers against BCMV to confirm resistance.
